## RESEARCH AND TEACHING INTERESTS

- **Mechanics of Earth processes:** creating novel observations and models of fundamental Earth processes ranging across phenomena including glaciers, earthquakes, volcanoes, landslides, and ocean waves; with special focus on connections between mechanical models and geophysical observables such as seismic waves
- **Fiber sensing:** leveraging the ongoing revolution in optical fiber-based sensing methods to make new observations of earth, environmental, and planetary processes. Encompasses existing technologies, i.e., distributed acoustic sensing (DAS) and distributed temperature sensing (DTS), as well as collaborations to develop new sensing strategies, i.e., over longer range or with lower power requirements
- **Environmental geophysics:** the use of seismology, remote sensing, fiber sensing, or other measurements of physical quantities to create knowledge about environmental systems
- **Glaciology:** ice dynamics, basal sliding, ice fracture, ice shelves and ice streams, ice-ocean interactions, surface mass balance measurement, novel sensor development, and connection to the climate system
